

## 1 Question 1

A basic attention mechanism is prone to generating weights not varying significantly enough to have efficient weighting across the sentences of the text. Hence, we can improve the model by adding a penalisation term. Lin et al. [1] notes that in this particular case, it is much more appropriate to use a term based on the Frobenius matrix norm rather than on the Kullback-Leibler divergence.

## 2 Question 2

According to Vaswani et al. [3] on Transformer, the main motivations for replacing recurrent operations with self-attention are: the considerably lower computational cost for each layer, along with better paralleling capabilities, and the lowering of the distance between long-range dependencies.

## 3 Question 3

0.08: There 's a sign on The Lost Highway that says : OOV SPOILERS  
OOV ( but you already knew that , did n't you ? )  
0.23: Since there 's a great deal of people that apparently did not get  
the point of this movie , I 'd like to contribute my interpretation of  
why the plot  
0.12: As others have pointed out , one single viewing of this movie is  
not sufficient .  
0.24: If you have the DVD of MD , you can OOV ' by looking at David  
Lynch 's Top 10 OOV to OOV MD ' ( but only upon second  
0.15: ; ) First of all , Mulholland Drive is downright brilliant .  
0.11: A masterpiece .  
0.08: This is the kind of movie that refuse to leave your head .

Figure 1: Sentences and word attention from HAN

One can see in 1 the encoding performed is not ideal. High word attention is set on what seem irrelevant words such as "Lost", "Highway", "that". Moreover, high sentence attention is set on what seem irrelevant sentences such as the second one, and low sentence attention is set on what seem relevant sentences such as the last 2.

## 4 Question 4

Limitation of Hierarchical Attention Network (HAN) is that attention-based encoding of sentences is independent between sentences. This means that a HAN can focus its attention on the same in-sentence structure without noticing relation of this structure across sentences. A Context-Aware Hierarchical Attention Network (CAHAN) proposed in Remy et al. [2] allows to adapt attention to the context of sentences, preventing high attention on redundant information.
